Vet Society Members

Dear Palm Beach Vet Society Members,

By the time you are reading this newsletter, our state senators and representatives will have concluded their business in Tallahassee for this legislative session. This particular session has been very contentious with the passage of several controversial bills, but the veterinary profession seems to have made it through unscathed. One bill entitled "The Practice of Veterinary Medicine" has passed both chambers and is on its way to be signed by the governor. This legislation will permit out-of-state veterinarians in good standing to perform

Steve Simmons, DVM

spay and neuter surgeries as an unpaid volunteer, under the supervision of a Florida licensed veterinarian.

The more controversial bill "Cosmetic Animal testing", introduced by Senator Book of Broward County, has died in committee. Although this bill sought to prevent the sale of cosmetics that are tested on animals, there were several other provisions hidden in the bill. For example, it dictated how people could transport their pets in their personal cars, preventing owners from holding pets in their lap or allowing them to put their head outside the window. Additionally, it would all but prevent the sale of rabbits in pet stores during the months of March & April. And finally, it would prevent veterinarians from performing declaw surgeries on cats.

This is the second time Senator Book has introduced legislation that would affect the way veterinarians in Florida are allowed to practice, and probably will not be the last time. In my opinion, this bill was too wide in scope and would be an overreach by government. But what makes this particular bill more insidious is that the fact the language was hidden deep inside the bill and was not mentioned in the summary. It is only after reading the entire language of the bill, that the full scope was revealed.

We must continue to be vigilant and use our voices to let our elected officials know where we stand on issues affecting the personal, professional and economic lives of veterinarians. If we do not speak up, someone else will make those decisions for us.

Sincerely, Steve Simmons, DVM

# Knowing The Causes Behind STOMATITIS

## Written by DON VAUGHAN

APRIL 2023, VOLUMBER 35/NUMBER 4 VETERINARY PRACTICE NEWS

Stomatitis is one of the most difficult conditions to treat among dogs and cats, often resulting in the removal of most of—if not all the patient's teeth. In September 2022, the Dentistry and Oral Surgery Service at the University of California, Davis (UC Davis) Veterinary Hospital debuted its stomatitis clinic, with a focus on diagnostic and therapeutic options.

"Stomatitis cases can present sig nif icant diag nost ic and therapeutic challenges," says Maria Soltero-Rivera, DVM, DAVDC, assistant professor of dentistry and oral surgery in the Department of Surgical and Radiological Services at UC Davis.

"We hope this dedicated clinic time will help support our patients, their caretakers, and the referral community in the management of these cases. This, along with the interdisciplinary collaborations that occur at the veterinary hospital and our ability to offer viable, novel treatment alternatives to unresponsive cases will increase the quality of care offered to these patients," says Dr. Soltero-Rivera.

Stomatitis is a general term to describe an inflamed and uncomfortable oral mucosa. Feline chronic gingivostomatitis (FCGS) is a moderate to severe form of stomatitis in cats that occurs in up to 12 percent of the species.<sup>1</sup> Prevalence in dogs is less well understood. In both species, the disorder is associated with significant morbidity.

"Stomatitis can be caused by infectious, immune-mediated or autoimmune, medication induced, cancerous, radiation-induced or idiopathic conditions," says Soltero-Rivera. "We currently see a variable number of cases per month in dogs and cats. With the inauguration of the Stomatitis Clinic, we will be able to see at least five to 10 cases of stomatitis during the clinic days."

### **Painful symptoms**

According to Soltero-Rivera, the most common signs of stomatitis

"In the area of diagnostics, next-generation sequencing has proved a novel diagnostic method that can be used to identify active genes and associated pathways within clinical specimens obtained from sick and healthy patients."

Systemic administration of mesenchymal stromal cells to a patient with feline chronic gingivostomatitis.

are oral pain and discomfort, which may manifest as difficulty eating or drinking, vocalization when eating, profuse salivation, decreased grooming, lethargy, and hiding behavior.

"We may also see bloody saliva and stained fur on the front limbs and neck, as well as weight loss," Soltero-Rivera says. "The condition is typically diagnosed by evaluating the presenting clinical signs, performing an awake and anesthetized evaluation of the pet's mouth, and obtaining samples of affected tissues for histopathological evaluation."

Lilli, a tortoise shell tabby owned by Cynthia Luke and Michael Lewis of Davis, Calif., was a textbook example of stomatitis in cats. The couple went on vacation when Lilli was three years old, and came home a couple of weeks later to find their pet in distress. "When we returned, Lilli had lost about five pounds and her kibble was all over the floor," *Continued on page 8*

# Knowing The Causes Behind STOMATITIS

Continued from page 5

says. "We knew something was wrong, so we took her to our local vet, who never used the word stomatitis. She looked in Lilli's mouth, told us there was nothing she could do, and suggested we take her to the UC Davis School of Veterinary Medicine."

Due to the extreme pain that may result from stomatitis, the condition can have an adverse effect on an animal's quality of life, as well as its caretakers. The pet may run away from the food bowl, avoid interacting with other pets and their caretakers, are unable to pick up toys with their mouth, and can progressively lose weight. Lilli presented with all these symptoms, Luke says.

"These pets need constant veterinarny attention and sometimes lifelong medications that can have unwanted side effects," says Soltero-Rivera. " Approximately one-third of cats affected by chronic gingivostomatitis, will not respond to any treatment and owners and veterinarians may be faced with the difficult decision of euthanasia due to exceptionally poor quality of life."

### **Treatment can be tricky**

The treatment of stomatitis depends primarily on identifying the cause of the condition and what veterinarians have historically learned works. Pain and infection are controlled with appropriate medications as well as extraction of infected teeth, and in certain situations, immunosuppressive medications may be considered.

"In cats affected with chronic gingivostomatitis, for example, the current gold-standard treatment is the extraction of most or all of the teeth," SolteroRivera says. "Even then, onethird of affected cats will show minimal to no improvement and alternative treatment options, such as stem cell therapy, immunomodulation, and pain

A 14-year-old cat that suffered from refractory gingivostomatitis and responded with a cure, four years after mesenchymal stromal cell therapy.

A 10-year-old cat suffering from refractory gingivostomatitis after full mouth extraction treatment and before mesenchymal stromal cell therapy.

management become necessary. In dogs affected by stomatitis, treatment also involves extraction of teeth with substantial periodontal disease, along with medical management."

When Luke and Lewis took Lilli to UC Davis, the attending doctor told them her prognosis was poor. "Really, all we could do was give her pain medication, and antibiotics when the lesions became really infected," Luke says. "The goal was to keep her comfortable and able to eat."

As a result, Lilli's quality of life was poor for several years. It was decided to

have all her teeth removed in the hope the

RTESY BOAZ

infections would ease, but the treatment proved ineffective, and Lilli became more fearful of her family. Toward the end of 2011, Luke and Lewis began discussing having Lilli euthanized.

Indeed, in the absence of a definitive known cause and the potential for multifactorial causes, the treatment of dogs and cats with stomatitis can be extremely challenging. Luckily, there has *Continued on page 9* 

# Knowing The Causes Behind STOMATITIS

#### Continued from page 8

been some promising research regarding diagnostics and treatments, Soltero-Rivera says.

In the area of diagnostics, extgeneration sequencing has proved a novel diagnostic method that can be used to identify active genes and associated pathways within clinical specimens obtained from sick and healthy patients. Veterinarians can evaluate patients for the presence of an array of microbes including viruses, bacteria, fungal, or parasitic organisms, and even neoplastic cells while at the same time determining how the patient is responding to the disease.

"This methodology will result in major advancements in prodental diagnostics, which have been traditionally limited to more subjective testing, namely dental charting and X-rays, along with histopathology at times," Soltero-Rivera says.

#### Stem cells show promise

When it comes to treatment, UC Davis's Dentistry and Oral Surgery Service has a history of pioneering treatment for feline chronic gingivostomatitis over the past decade, establishing a novel clinical trial utilizing stem cell therapy. As success of the trial grew, with 72 percent of cats treated exhibiting positive results,<sup>2</sup> it evolved into several national trials at multiple clinics and universities around the nation. The final product for an accepted protocol of feline chronic gingivostomatitis is currently under clinical trials to enable FDA approval, says Soltero-Rivera.

Lilli was a beneficiary of UC Davis's stem cell research. Just as Luke and Lewis were discussing having Lilli euthanized, they were informed she qualified fora new stem-cell study. The first surgery used Lilli's own stem cells, which resulted in a small improvement. A second surgery using stem cells from a donor worked almost immediately.

"It was noticeable she was eating a lot and seemed to be happier, so I started cutting back on her medications," Luke says. "She started playing with her sister, eating a lot, and frolicking in the backyard. Very shortly she was drug-free. We got to watch Lilli be a happy, normal cat for eight years after the surgery. It was a real gift."

Stomatitis is difficult to treat and can be equally difficult to prevent. "To date, there are no known preventive strategiesfor stomatitis in dogs and cats," Soltero-Rivera says. "Timely evaluations of the oral cavity of pets by veterinarians, as well as a strict oral care regimen at home, may help us pick up the earliest signs associated with this condition."

As research into stomatitis continues at UC Davis and other institutions, the information gleaned will be made available to all practioners. "The creation of a first-ofits-kind focused clinic for cats and dogs is the next step in the natural progression of our groundbreaking work in the disease," says Soltero-Rivera. "Stomatitis cases are considered a high priority, as they have drastic negative impacts on the patient's quality of life. As such, this dedicated time offered by the Stomatitis Clinic will provide a means to serve more animals in a timely manner. Beyond immediately helping patients in need, the clinic will be a platform for interdisciplinary and transdisciplinary research to advance knowledge on this devastating condition."

Lilli passed away in 2020, and her family was grateful for the extra time they had with her. "Lilli enriched the lives of our family and taught us so much about love and caring for an ill loved one," Luke says. "This experience sent my son, who was close to Lilli, down a different path as well. He went to medical school and is now in his residency."

## ADVANCED VETERINARY DERMATOLOGY DR. URSULA OBERKIRCHNER BOARD CERTIFIED VETERINARY DERMATOLOGIST

Advanced Veterinary Dermatology (AVD)

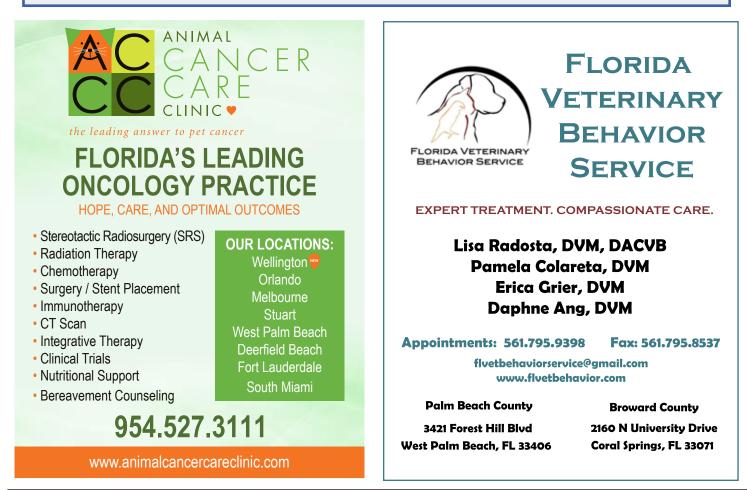

located in Wellington, Florida, is a specialized practice focused solely on skin, ear, and nail conditions in dogs and cats. Dr. Ursula is a board-certified veterinary dermatologist certified both in the U.S. and Europe. Her experience and focus on skin and ear care, enables Dr. Ursula to accurately diagnose the cause of the problem and develop the safest, most effective treatment plan.

Dr. Ursula is accepting referrals and will work with the referring primary veterinary on diagnosing and treating skin allergies, ear problems ranging from outer ear infections to middle ear infections, growths, auto-immune skin diseases, bacterial and fungal skin infections and more.

- Management of skin allergies
- Management of skin or ear infections
- Video-otoscopy
- Diagnosis and treatment of nail problems
- Diagnosis & treatment of alopecia
- Diagnosis & treatment of auto-immune skin diseases

Fellow practitioners please be sure and verify the certification of any veterinary dermatologist you refer at www.ACVD.org
